

## **Roger Zuniga**

### **Back-end Developer, EsKort Product Development, Systems and Database Administration**

Roger has been interested in computers ever since he can remember and before that with anything you could take apart. The real love relationship with computers and technology started when he discovered dial-up BBS then the Internet. Sometimes the fascination is about languages themselves (and their progressive evolution to serve human complexity) and sometimes it's about communication (and its ardent changes), but more and more it is just about human interaction and the way we are seeing it take leaps before our eyes.

Over the last 15 years, he has worked for such notable companies as Linksys, Intel and the Melton Foundation doing everything from web and application development to systems integration to server and database administration, Highlights of languages and systems include: PHP, HTML, CSS, JavaScript, Java, Perl, Visual Basic, Bash, Linux, FreeBSD and Windows server administration, DNS, Apache and IIS web servers, SQL, MySQL, PostgreSQL databases, all mail protocols, and UML, XP and Agile development methodologies.

Roger's diverse and extensive knowledge helps Animus Rex solve almost any application, infrastructure or technology related problem that might surface during a project and allows us to provide a rock-solid infrastructure for EsKort, our web development platform.
